

AI Workflow Audit

Task Description	Task Type	Rationale
Frontend design with API integration	Delegate to AI with Review	AI can generate boilerplate UI to speed up the process
Resume Profile Update	Delegate to AI with Review	The AI has context on my skills and my role and can generate my profile based on that
Entire Backend for the Notes CRUD Project	Collaborate with AI	Using AI as a coding partner can speed up development
Modify Alarm	Fully Automate	Trivial tasks can be automated by AI assistants on mobiles
Implementation of a Custom Webhook	Delegate to AI with Review	Small components of code can be generated by AI and then refined to speed up development
Explain the Code Structure of Open Source Hyprrland Desktop Environment	Collaborate with AI	AI can load vast amounts of context and condense it for the user to understand, something that can take weeks can be understood quicker
Study Database Sharding and Partitioning	Just Me	Understanding of foundational concepts cannot be outsourced
Creating this Sheet	Delegate to AI with Review	Using AI to review the work helps to gain an outside perspective that helps me to focus on the right things
Frontend Project Requirements Analysis	Delegate to AI with Review	AI can be great for generating development workflows for projects to breeze through the designing phase.
SQL Migration Review	Delegate to AI with Review	Ais are very good with SQL nowadays they can be used to review queries before a potential disaster

Claude Setup

Custom Instructions:

Who I am:

- A third-year Computer Science student at FAST-NUCES, Karachi, and an aspiring backend software engineer.
- Focused on building robust, scalable backend systems, relational databases, and efficient software architectures.

Tone & Communication Preferences:

- Be direct, technical, and precise. Skip superficial filler, polite padding, or excessive hand-holding.
- Highlight logical, architectural, or systematic flaws directly and critically rather than adopting a diplomatic stance.
- Provide clean, production-ready code examples and concise explanations.

Current Goals:

- Complete the FlyRank AI internship workflows successfully, executing rigorous AI-augmented engineering audits and projects (FL-01 through subsequent phases).
- Sharpen backend development practices, database design, and modern systems engineering workflows.

Target Tasks:

1. Frontend Design with API Integration

- **Why it was selected:** It bridges UI scaffolding and backend data wiring, a frequent bottleneck where structured AI assistance can significantly accelerate feature shipping.
- **Definition of "Done Well":**
 - The generated frontend components successfully consume the backend API endpoints without type mismatches.
 - State management handles loading, error, and success states cleanly.
 - Minimal manual refactoring is required to plug the UI into the backend specification.

2. Generating Development Workflows & Step-by-Step Roadmaps from Project Specs

- **Why it was selected:** Crucial for breaking down high-level project ideas into granular, actionable execution steps before writing any code.
- **Definition of "Done Well":**
 - The generated roadmap breaks the project down into logical, chronological phases (e.g., database design, backend routes, frontend views).
 - Each step includes clear technical milestones, folder structures, and specific implementation dependencies without hand-waving or missing crucial architectural pieces.

3. Document Generation (README, API Specs, and Project Documentation)

- **Why it was selected:** Automates the tedious parts of technical writing while maintaining professional documentation standards for my repositories.
- **Definition of "Done Well":**
 - The generated documentation accurately reflects the codebase architecture, setup instructions, and endpoint specifications.
 - Formatting is clean (Markdown), and no placeholders or hallucinated endpoints are present in the final output.
